TITLE: Communication system for selecting a communication transmission method

### ABPL:

L8: Entry 13 of 31

A wireless communication system and process for transmission of data communications, may be practiced with a microprocessor, a memory, a controller, a selector and a communication block, and the effect of the wireless communication system for selecting a communication transmission method lies in the fact that a user can select a wireless communication device according to user's needs in a wireless communication device having at least one communication transmission method or a plurality of wireless communication devices having different communication transmission methods, using only one controller.

TITLE: Integrated communications architecture on a mobile device

#### CLPV:

selecting via the mobile device a communication method for connecting the computer and the mobile device, the communication method selected from a plurality of methods including both remote and local connections;

L8: Entry 24 of 31 File: USPT May 14, 1996

DOCUMENT-IDENTIFIER: US 5517553 A TITLE: Wireless communication system

#### ABPL:

This invention relates to a wireless communication system, which comprises plural wireless communication units having different communication protocols, and in which a proper wireless communication unit is automatically selected from the plural wireless communication units in accordance with the operation states of the plural wireless communication units to make communication possible. Thereby, troublesome operation is not required, an optimum wireless communication method can be automatically selected, and communication cost can be reduced. In the wireless communication system of the present invention, when mobile stations are registered in a fixed station, preferential orders of the mobile stations are stored, and calling/call-reception and communication processings are controlled according to the preferential orders.

DOCUMENT-IDENTIFIER: US 6038664 A

TITLE: Method for selecting communication access method for local area networks

#### ABPL:

A method is provided for <u>selecting between various communication access methods</u> for client computers which are connected to a computer network. When a client computer attempts to load an application program, the system loader on the client computer is hooked or paused. A preset configuration may be evaluated to determine if the user will be prompted to select an access method, if a particular access method is preset, or if a rules database will be evaluated to select an access method. If a Remote Node access method is selected, the system loader is unpaused and the selected program is allowed to run on the remote user's computer. If a Remote Control access method is selected, a remote control program is executed at the server. A load balancing algorithm may be used to determine which server will be used if a plurality of servers are available on the computer network for hosting a Remote Control session.
